# INSTRUCTIONS FOR OPERATION AND CARE OF YOUR HI-STANDARD DERRINGER

#### LOADING:

Yaur High Standard Derringer is a break-open type two shot pistol with superposed barrels, one barrel is located above the other.

Ta load the gun, abtain a firm hold on the stirrup with your thumb and forefinger af either hand and lift up until the stirrup disengages the locking lug an the "L" frame. The breech end of the chambers is now easily accessible and two cortridges, short, long, ar long rifle — standard or high velocity — may be inserted. IMPORTANT: When using .22 shorts, due to the short length of the cartridge, they may slip under the extractor if the extractor is held in extracted position. It is advisable to first push the stirrup into a parallel position with the borrels thereby returning the extractor until it is flush with the breech face while the barrels are in the open position before inserting coliber .22 short cartridges. A simple pressure an the reor portion of the barrel will snap the stirrup in place and lock the barrels in place.

CAUTION — Keep fingers free of trigger at the time of loading the chombers and point the gun in a sofe direction, preferably towards the ground.

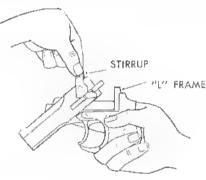

FIGURE 1

## FIRING:

This is a double action pistol in which a mechanism is incorporated that alternates the striker between the lawer and upper chambers. To fire the pistol, it is only necessory to apply steady pressure on the trigger until the hommer falls carrying the striker to a cartridge rim. The firing mechanism is non-selective; for example, if the lower barrel had been fired last, the upper barrel will be discharged on the next pull of the trigger and vice-versa.

# UNLOADING OR REMOVAL OF FIRED CARTRIDGE CASES:

In order to remove either live cartridges or fired cases from the barrels, it is only necessary to lift the stirrup in the same manner as described on the loading procedure, Extraction and ejection are automatic.

# CARE AND MAINTENANCE:

1. Before first firing the gun, make certain that the bare is clean and free from any abstruction. If the bare has been filled with grease far extended storage, all grease shauld be removed before shapting by swabbing out the bares with a

- .22 caliber bore cleaning tool. Also remove any excessive accumulation of oil from inside of the barrels.
- After extensive shooting, cleaning will become necessary.
   The use of kerasene or any other good cleaning solution is recommended.
- 3. In cleaning the muzzle, an old toothbrush or similar brush should be used. If mud or foreign matter should enter the bore, a stiff bristle brush ar copper wire brush for .22 caliber guns should be used. After brush has removed all mud and foreign matter, the bore should be swabbed with flannel patches attached to a .22 caliber cleaning rod. Patches should be maistened with a good gun oil and the swabbing of the bore should be continued until the patches come out clean.
- 4. After the face an the "L" frame apposite the breech end of the barrels has been tharoughly cleaned, drap a few drops of light badied ail through the striker apening into the action.
- 5. The entire gun should be wiped dry of kerosene ar cleaning salution with a clean absorbent cloth and the surfaces should be wiped with a lightly-oiled patch.
- 6. For best results in rust prevention, only high quality gun lubriconts should be used. (See your dealer)
- 7. Avoid using heavy-badied ails. Na animal or vegetable oils should ever be used on guns.
- 8. If the gun is used in climates where extreme cold prevails, powdered graphite should be substituted for all in lubricating the internal mechanism. In maist climates the gun should be cleaned more frequently and preferably stared in a container treated with silicone to prevent rust.

#### DRY FIRING:

In dry firing the pistol, it is best to first insert dummy cartridges or fired cases into the chambers. These will prevent damage to the striker and chambers.

HI-STANDARD PISTOLS ARE FACTORY TESTED WITH ALL STANDARD BRANDS OF AMMUNITION

TAKEDOWN IS RECOMMENDED BY QUALIFIED GUN-SMITHS ONLY

- 1. Remove grips.
- 2. Remove cover plate screw, part #1913, without remaving hammer pivot screw, part #1936. Lift aff caver plate.
- 3. Partially cock the hommer by pulling trigger until the hole in the hommer strut, part #1929, emerges below the hammer strut plate, part #1921. Insert drift punch into said hale and release trigger, thereby removing tension aff hammer spring; hammer strut assembly can now be lifted out in one unit. Actuator, port #1937, and actuator spring, part #1939, can now be removed.
- 4. Remove hammer pivot screw, part #1936; hammer assembly and housing can naw be removed from "L" frame. When removing hammer assembly, take core not to lose hammer pivot sleeve, part #1922.

#### REVERSE PROCEDURE FOR RE-ASSEMBLY
